Your drinking water comes from the Great Miami Buried Valley Aquifer. Thirteen production wells produce up to twenty million gallons per day of drinking water. The untreated well water is pumped to the Water Treatment Plant where it is softened using lime, disinfected with Chlorine, and then filtered through dual media water filters. Before the finished water is pumped to the residents of the City of Middletown, Fluoride is added as a measure to prevent tooth decay. Middletown has also established water supply connections with Warren County and the City of Monroe. These emergency connections were established for extraordinary conditions such as drought, source failure, line breaks, fires, and other periods of unusually high water demand.

The contents of drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at 1-800-426-4791.

To ensure tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in drinking water provided by public water systems. Our dedicated team of certified operators and laboratory personnel monitor the treatment process and frequently test the water supply to make sure the highest standards for drinking water quality are met at all times. The Ohio Environmental Protection Agency requires Middletown to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. The EPA requires regular sampling to ensure drinking water safety.

Chlorination of drinking water began in the early years of the 20th Century in Great Britain, where its application sharply reduced Typhoid deaths. Shortly after this dramatic success, Chlorination of drinking water was introduced into the United States, which has resulted in the virtual elimination of waterborne diseases such as Cholera, Typhoid, Dysentery, and Hepatitis A. Chlorine has protected America’s drinking water supply from waterborne infectious diseases for nearly a century. The certified operators at the City of Middletown’s Water Treatment Plant make sure the water is properly Chlorinated. The average level of Chlorine found in the drinking water in 2015 was 0.64 ppm. The range of detections was from 0.21 ppm to 1.08 ppm.

How do I participate in decisions concerning my drinking water? Public participation and comments are encouraged at regular meetings of City Council or by calling one of the numbers listed below. Important information is also available on the web at www.cityofmiddletown.org.

Protecting our water source is one important way the City of Middletown limits contaminants in our drinking water. The Ohio Environmental Protection Agency (OEPA) recently completed a study of the City of Middletown’s source of drinking water to determine its susceptibility. According to this study, the aquifer (water-rich zone) that supplies water to the City of Middletown has a high susceptibility to contamination. This determination is based on the following:

- Lack of a protective layer of clay overlying the aquifer;
- Shallow depth (less than 15 feet below ground surface) of the aquifer;
- The presence of significant potential contaminant sources in the protection area; and
- Past detections of manmade contaminants in Middletown’s aquifer

The risk of future contamination is being minimized by implementing appropriate protective measures. The City of Middletown has developed and implemented a comprehensive Wellhead/Source Water Protection Plan to help prevent potential contamination from entering the aquifer. The protection plan contains an educational component, source control strategies, a contingency and emergency response plan, and ground water monitoring strategies.
More information about the source water assessment or what consumers can do to help protect the aquifer is available by calling (513) 425-1860 or (513) 425-7781. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in some water include:

(A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

(B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

(C) Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water runoff, and residential uses.

(D) Organic chemical contaminants, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff and septic systems.

(E) Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. The City of Middletown is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.”

Maximum Contaminant Levels (MCLs) and Maximum Contaminant Level Goals (MCLGs) have been established by the EPA for many substances in drinking water. MCLs and MCLGs are based on scientific information about possible health effects of these substances. The safe drinking water supplied by the City of Middletown consistently meets or exceeds established water quality standards. Information concerning detected contaminants is listed in this report. Although a very small amount of contaminants were detected in the drinking water, the level at which they were detected poses no known or expected risk to health. As shown in the table included with this report, sampling results indicate contaminants in Middletown’s drinking water are well below the MCLs.

PUBLIC NOTICE – MONITORING REQUIREMENTS NOT MET IN DECEMBER 2015

The City of Middletown did not meet the required Coliform monitoring requirements in December 2015. The City is required to collect and test 50 routine samples per month. For the month of December 2015, 49 sample results were submitted to Ohio EPA which is a violation of Ohio Administrative Code Rule 3745-81-21.

What should you do?
- There is nothing you need to do at this time. You do not need to boil your water or take other corrective action.
- This notice is to inform you that Middletown City PWS did not monitor and report results for the presence of total coliform bacteria in the public drinking water system during the December 2015 time period, as required by the Ohio Environmental Protection Agency.

What is being done?
- The City of Middletown is taking action to notify the people served by our water system concerning the December 2015 monitoring violation.
- We are now collecting 52 routine samples each month to ensure adequate monitoring will be performed in the future.

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.
### Disinfectants & Disinfectant By-Products

Disinfectant and disinfectant by-products are necessary for the control of microbial contaminants in drinking water. Some by-products, such as Haloacetic Acids (HAA5), Chlorine, and TTHMs (Trihalomethanes), are regulated to ensure they do not pose a risk to public health.

**Haloacetic Acids (HAA5) (ppb)**
- **MCLG**: NA
- **MCL**: 60 ppb
- **Sample Date**: 2015
- **Typical Source**: By-product of drinking water chlorination

**Chlorine (as Cl2) (ppm)**
- **MCL**: 4 ppm
- **Sample Date**: 2015
- **Typical Source**: Water additive used to control microbes

**TTHMs [Total Trihalomethanes] (ppb)**
- **MCLG**: NA
- **MCL**: 80 ppb
- **Sample Date**: 2015
- **Typical Source**: By-product of drinking water disinfection

### Inorganic Contaminants

Inorganic contaminants such as Barium, Fluoride, and Nitrate can affect the taste and quality of drinking water, as well as pose health risks at high concentrations.

**Barium (ppm)**
- **MCLG**: 2 ppm
- **MCL**: 2 ppm
- **Sample Date**: 2014
- **Typical Source**: Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits

**Fluoride (ppm)**
- **MCLG**: 4 ppm
- **MCL**: 4 ppm
- **Sample Date**: 2015
- **Typical Source**: Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories

**Nitrate [measured as Nitrogen] (ppm)**
- **MCLG**: 10 ppm
- **MCL**: 10 ppm
- **Sample Date**: 2015
- **Typical Source**: Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits

**Lead - action level at consumer taps (ppb)**
- **MCLG**: 0 ppb
- **MCL**: 15 ppb
- **Sample Date**: 2013
- **Typical Source**: Corrosion of household plumbing systems; Erosion of natural deposits

**Copper (ppb)**
- **MCLG**: 0 ppb
- **MCL**: 1350 ppb
- **Sample Date**: 2013
- **Typical Source**: Corrosion of household plumbing systems; Erosion of natural deposits

---

**Definition of terms contained in this report:**
- **MCL** = Maximum Contaminant Level (The highest level of a contaminant that is allowed in drinking water)
- **MCLG** = Maximum Contaminant Level Goal (level below which there is no known or expected health risk)
- **ppm** = Parts per million, or milligrams per liter (mg/L)
- **NA** = Not applicable
- **AL** = Action level
- **ppb** = Parts per billion, or micrograms per liter (ug/L)
- **ND** = Not detected
- **n/r** = Not regulated

Some people may be more vulnerable to contaminants in drinking water than the general population, including immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the [Safe Drinking Water Hotline (1-800-426-4791)](tel:1-800-426-4791).
